DETAILED ACTION

1. Applicant's election without traverse of Group , claims 24-40 in Paper No. 7 is acknowledged. Claims 1-23 and 40- 45 are withdrawn from consideration.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made

3. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 24-40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Baur combined with Lenoir et al. and Lenoir-Viale et al.

The claims are drawn to methods of selection of keratinocyte precursor cells for the production of epidermal equivalents. Baur teaches all limitations of the cited claims with the exception that Baur teaches that the plucked hair is not cultured in toto but instead is subject to dissection and the hair bulb and infundibular parts are removed and subsequently cultured.

Lenoir et al. and Lenoir-Viale et al. disclose the production of epidermal equivalents from human hair follicles. Lenoir et al. teaches the removal of the bulb merely as a convenience in order to insert the follicle in the collagen. Lenoir et al. also presents Figure 1 which indicates that the area of the follicle containing the outer root sheath cells which contain the precursors for the keratinocytes that are ultimately found in the epidermal equivalents.

Absent objective evidence to the contrary, it would have been obvious to one of ordinary skill in the art at the time the invention was made to reduce the time and cost of hair follicle processing in the production of an epidermal equivalent in the manner taught by Baur by simply culturing the hair follicle immediately after plucking since Lenoir et al. and Lenoir-Viale et al. remove the bulb for matters of convenience rather than criticality to the production of the equivalent. All that is required is a reasonable expectation of success and as other cells are present at the time of hair follicle culture and since the culture conditions are directed towards the continued culture and differentiation of the outer root sheath cells, skipping the dissection/cutting step would not be expected to interfere with the expected outcome of the disclosed invention, i.e. the production of an epidermal equivalent.
